☎ 8098118285

📍 1st STREET , NALLUR VILLAGE , KADAPAKKAM POST, CHEYYUR
TALUK, CHENGALPATTU DISTRICT -603304

OBJECTIVE

To work in an environment which encourages me to succeed and grow professionally where I can utilize my skills and knowledge appropriately.

EXPERIENCE

-

INTERNSHIP

EduSkill

It's a Online internship

It's is 8 week course

They provide a certificate after completed the final assessment

EDUCATION

2021-22

SSLC

K.V.S MATRIC HR SEC SCHOOL

PROJECTS

HEALTHCARE ASSISTANT USING AI

The Smart Healthcare Assistant using Artificial Intelligence is an intelligent system designed to provide basic healthcare support and guidance to users. This project uses concepts from Artificial Intelligence and Machine Learning to analyze user inputs such as symptoms and provide possible health-related suggestions.

The system acts as a virtual assistant that interacts with users through text or voice, helping them understand their health condition, suggesting preventive measures, and recommending when to consult a doctor. It can also provide information about common diseases, medications, and healthy lifestyle practices.

By using AI algorithms, the assistant improves its responses over time, making it more accurate and user-friendly. This project aims to reduce the gap between patients and basic medical advice, especially in situations where immediate consultation is not possible.

BLOOD PRESSURE MONITOR USING AI

The Smart Blood Pressure Monitoring System is a device designed to measure and monitor a person's blood pressure in a simple, accurate, and efficient way. Blood pressure is an important indicator of human health, especially for detecting conditions like Hypertension and Hypotension.

This system uses sensors to measure systolic and diastolic pressure and displays the readings digitally. The device can be integrated with microcontrollers or mobile applications to store and track data over time. Some advanced versions may also include alerts when the readings go beyond normal levels.

The main goal of this project is to provide a portable and user-friendly solution for regular health monitoring. It helps individuals keep track of their blood pressure without the need for frequent hospital visits, promoting early detection and better management of health conditions.

HEAVY SMART TRAFFIC DETECTION USING AI

The AI-Based Heavy Traffic Detection System is an intelligent solution designed to monitor and analyze traffic conditions in real time. This project uses concepts from Artificial Intelligence and Machine Learning to detect traffic congestion and predict heavy traffic situations.

The system collects data from sources such as cameras, sensors, or GPS and processes it using AI algorithms. By analyzing vehicle density, speed, and movement patterns, the system can identify traffic congestion and classify it as low, medium, or heavy.

It can also provide real-time updates and suggest alternative routes to reduce travel time. This helps drivers make better decisions and reduces traffic congestion in urban areas. The system can be integrated with navigation apps or smart city infrastructure for better traffic management.
